In this article, there is a sentence inconsistent with the content of the article, which needs to be deleted. Please help us to fix this mistake. The authors express regrets for this confusion.

Data extraction

The papers were extracted from the following databases: China National Knowledge Internet (CNKI), China Biology Medicine disc (CBM), VIP Database (VIP), Baidu Scholar, PubMed, Scopus (Elsevier), Embase and Ovid. The following information was extracted from each eligible study: First author's surname, data of ACS patients complicated with gastrointestinal bleeding (sample size, group information, therapeutic method, disease course, intervention duration and curative effect), year of publication, and included database. All procedures con-

form to the principles of the Declaration of Helsinki. Search strategy: Chinese terms for "Acute coronary syndrome" and "risk factors for gastrointestinal bleeding" were searched in Chinese databases; English terms for "Acute coronary syndrome" or "ACS" and "Gastrointestinal bleeding" or "bleeding" and "risk" were searched in English databases. The selected literature included both Chinese and English literature sources, and animal experiments were excluded. References were also searched (Figure 1).
